

TP of Sample Simulation of Cryptography System Using Caesar Cipher And Network Security Operation Using SSH

1. Caesar Cipher Operation and Understanding

- a. Encryptor = $(X + n) \bmod 26$ and Decryptor = $(X - n) \bmod 26$
 - Explain how does it work and the objective of each operator
 - If we use the value n which is the biggest prime number from 0 to ascii code value of X , how is the system changed
 - And then combine with the operation of the index of X how is it changed?
- b. Try to find the solution to break all the technique of each case

2. Network Remote Access with Secure Operation using SSH Protocol

- a. A pair of students needs to work as a group and construct the remote access operation of client and server accessing:
